INTRO

The COVID-19 pandemic created new barriers and challenges to accessing primary care services, particularly among older adults who already faced barriers related to access to care, including transportation, health literacy, and selfmanagement support. Nova Southeastern University South Florida Geriatric Workforce Enhancement Program (NSU SFGWEP) partnered with primary care clinics to conduct wellness calls to older adult patients identified through clinic EHR. The wellness calls' objectives were to 1) discuss COVID-19 protective measures; 2) assess wellness needs and access to care barriers; and 3) screen for telehealth support.

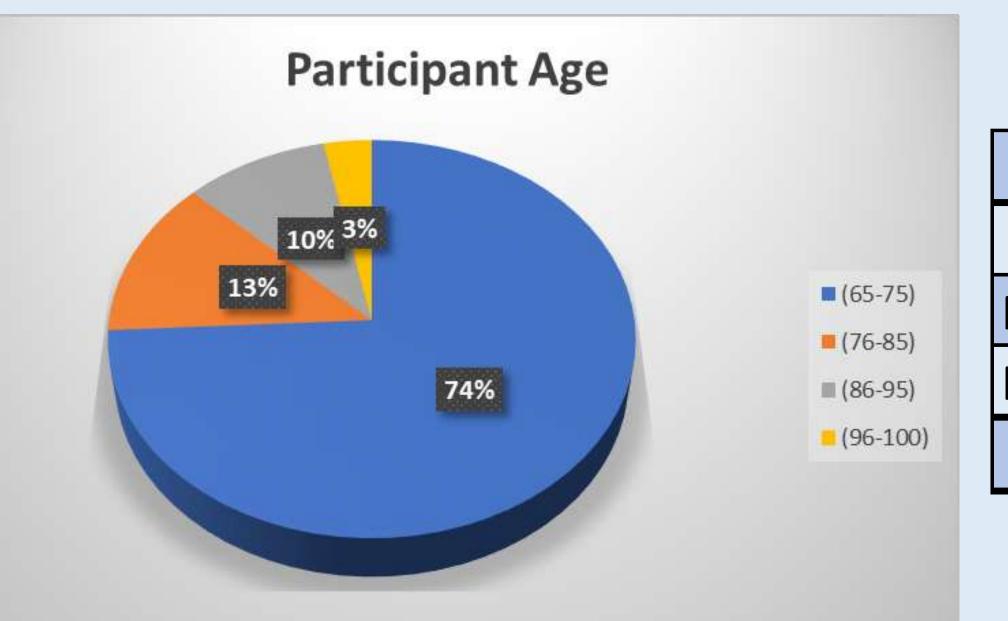

METHODS

The study identified about 200 older adults who were patients of the NSU Health clinics. The participants were identified through an Electronic Health Record report. The inclusion criteria included: older adults aged 65 years and above, having a last medical encounter within the past 12 months, and having primary insurance of Medicaid, Medicare, or commercial or private insurance. From September 2020 to February 2021, the team (including medical students, public health students, and SFGWEP staff) contacted 200 patients via telephone and conducted a comprehensive wellness survey developed by the study team, informed by validated surveys.

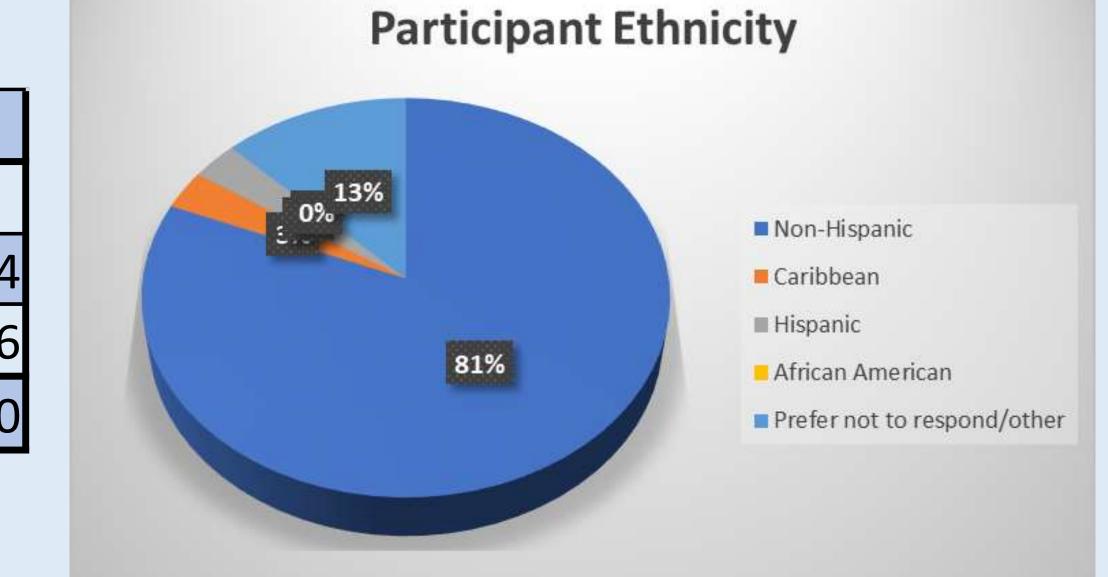

Assessing Needs, Well-being, and Telehealth Access of Older Adults with Limited Resources during COVID-19 Pandemic

RESULTS

Among the 200 patients called, 32 (16.3%) completed the wellness survey. Therefore, survey results were evaluated based on the 32 individuals who completed surveys. During discussion based on the pandemic, 19 (60%) expressed that they were very concerned about the COVID-19 pandemic. Regarding barriers, 79% (n=25) expressed difficulty getting medical care; one person reported limited access to COVID-19 testing, one reported lack of face masks, and one reported challenges with obtaining medication refills. Overall, 16% (n=5) of the participants voiced concerns over health and wellness, potentially influencing their access to care. Thirty-four percent (n=11) reported often feeling isolated from others When screened for telehealth services and support, 53% (n=17) of the individuals said that they lacked knowledge about seeing their provider via telehealth, 56% (n=7) had limited information on education and resources, and 47% (n=15) expressed the need for telehealth education.

CONCLUSION

Wellness calls provided an opportunity to connect with older adults and to assess them for wellness needs. While the team could only complete wellness calls with 16% of identified older adults, we learned that loneliness and social isolation are significant risks. Therefore, there was a need for education and resources around telehealth, internet connectivity, devices, and phone connection. As a result of the wellness calls, a specific need for telehealth supporting devices was identified. Thus, SFGWEP provided Samsung Tablets (n=50) with preloaded education modules on COVID 19 resources and technical support to help facilitate telemedicine visits. Participants were also offered telehealth education and access to the virtual training modules uploaded on the SFGWEP website.
